

VIDEO TOASTER[®] FLYER[™]

The Tapeless Editor...

VIDEO TOASTER FLYER

Tapeless Editing

The Video Toaster Flyer is the first affordable, broadcast-quality, nonlinear edit system.

No other editing system in the world compares to the quality, price, and ease of use of NewTek's revolutionary new Video Toaster Flyer.

Affordable Online Editing

For \$3995, the Video Toaster Flyer provides the same D2 quality image you expect from a \$50,000 digital video deck. The Flyer integrates so seamlessly with the Video Toaster that you'll be able to experiment with effects, try out different titles, or add animations with ease.

NewTek's exciting new video compression standard, VTASC, enables you to get the quality you want without the unwanted artifacts associated with JPEG, MPEG, Wavelet and other compression techniques. Your final productions will look better instantly with the Flyer since there's no tape generation loss.

Simple, Fast, Friendly

With the Flyer, editing is an exciting process of experimentation and creativity. You start by recording clips into the Flyer (a clip is a segment of video along with stereo audio). Each clip is represented by a color picture taken from one of its video frames called a crouton. You fine-tune each crouton—select in and out points, and adjust audio characteristics—until the clips are perfect.

The next step couldn't be simpler. Drag a video crouton into position, place an effect crouton after it, then drop another video crouton after the effect. You've just created a transition from one video clip to another. To add a graphic or overlay CG text, drag and drop a graphic crouton. With the Flyer it's easy to build a storyboard where every scene, sound, graphic, and animation appears in the order you want.

Now for the fun part—press the play button. Watch the entire production roll as each of your clips, effects and graphics plays back in real-time, full broadcast quality. Record your finished production directly to another Flyer-controlled hard drive (for maximum image quality) or to any video format.

Seamless Integration with the Video Toaster

Since the Flyer has been designed as a component of the Video Toaster system, it seamlessly integrates with your Toaster-based studio. Harness all of the effects, graphics and animation features that have made the Toaster one of the most popular video tools ever. Use recorded video clips as easily as video still frames. You can even insert video clips into your LightWave animations. This feature, called rotoscoping, allows you to place live video segments—as many as you want—inside your LightWave animations. You have as much control over moving images as you have over stills.

Now Hear This...

With the Video Toaster Flyer in your studio, the Video Toaster system edits audio as well as video. The Flyer's audio capabilities allow you to use it as a sophisticated sound mixer featuring multiple tracks of CD-quality digital audio. Add background music, perform audio sweetening, or just bring up the volume of a quiet passage to match that of other clips.

The Complete Production Solution

Add a Video Toaster Flyer and a couple of hard drives to the Video Toaster 4000 to form a complete audio and video production suite that fits on your desk.
